Verviam IDaaS with AWS Client VPN

June 2023

Product Overview

VPNs encrypt your internet traffic, creating a secure tunnel between your device and the VPN server. This encryption prevents anyone from intercepting or accessing your data, protecting it from hackers and eavesdroppers. Your IP address is masked, making it difficult to track and gather personal information.

Mutual Authentication

With mutual authentication, Client VPN uses certificates to perform authentication between the client and the server. Certificates are a digital form of identification issued by a certificate authority (CA).

Active Directory UserID and Password

Verviam Client VPN provides Active Directory support, integrating with AWS Directory Service. With Active Directory authentication, clients are authenticated against existing Active Directory groups. Client VPN can connect to existing Active Directories provisioned in the cloud or in your on-premises network.

Details

Multi-Region - AWS Client VPN endpoints across multiple AWS Regions, and allow users across all endpoints to authenticate against a single directory globally.

Bandwidth - There is a 10 Mbps bandwidth limit per user connection.

Secure connections — secure TLS connection from any location using the OpenVPN client.

Managed service — It is an AWS managed service, removing the security and operational problems of deploying and managing a third-party remote access VPN solution.

High availability and elasticity — automatically scales to the number of users connections

Identity Security — Configured with Verviam Identity Federation, the Client VPN provides additional layers of authentication making it an extremely secure identity management solution.
